This paper claims that Superb Fairy-wrens (*Malarus cyaneus*) will go extinct soon to due small climate change impacts.

...But I love Superb Fairy Wrens!
So, did the paper get it right? Will they go extinct (locally) and what influence do climate trends have on national bird species?

Figure 7: Predictive Linear Regression Model for Average Fairy-wren Populations and Scaled National Bird Index

Regression Analysis for the Logged Average Fairy-wren population at the ANBG. The 95% HDI predictive band is **not inconsistent** with national relative abundance trends in the National Bird Index.

Fairy-wren populations at the ANBG – **DOWN**

Annual Mean Temperatures in Australia – **UP**

National Bird Index and Annual Mean Temperatures – **SIGNIFICANT**
